

Jadvix HubOS — *the control tower for logistics*

One platform that a logistics company runs its entire operation on — every hub, every shift, every driver, every delivery, and every rupee — while Jadvix sells it, meters it, and bills for it.

- 6 role-based portals
- Multi-company · Multi-hub
- 15 operating modules
- Usage-based revenue

Working name. “Jadvix HubOS” is a placeholder for this brief. Alternatives worth testing: **HubGrid**, **Relay**, **Dispatch Tower**, **FleetDesk**. Final name is an open decision.

THE PROBLEM

Running many hubs is a coordination nightmare

A logistics company with several delivery hubs is really running several small businesses at once — each with its own staff, vehicles, shifts, deliveries and payroll. Today that is stitched together with spreadsheets, WhatsApp groups and trust.

- No single source of truth**

Each hub tracks products, bays and drivers its own way. The head office can’t see what’s actually happening hub-by-hub, in one place, right now.
- Accountability is fuzzy**

When a delivery fails, a vehicle is damaged, or salary doesn’t match, there’s no clean trail of who did what — so problems repeat and disputes drag on.
- Attendance & vehicle safety are unverified**

Was the driver actually present? Was the van roadworthy this morning? Nobody has proof until something goes wrong.
- Billing & payroll are manual**

Counting employees and hubs, prorating leavers, raising invoices and paying salaries by hand is slow and error-prone — and it’s where money leaks.

OUR SOLUTION

One system, sold as a service, run by role

Jadvix HubOS is a multi-tenant platform. Jadvix operates it and sells access to logistics companies. Each company runs all of its hubs inside it, and every person — from head office to a driver on the road — sees exactly the portal and the modules their role needs, and nothing more.

SELL

Jadvix meters & bills

The Master Portal tracks every company, hub and employee created, and turns that into a monthly invoice automatically.

CONFIGURE

Companies self-manage

A company's Super Admin creates hubs, issues credentials, and decides which modules each role in each hub can touch.

OPERATE

Hubs run the day

Hub authorities plan shifts and bays; drivers check in with vehicle photos, run deliveries, and raise queries — all logged.

The result: head office gets live, hub-by-hub visibility; frontline staff get a focused tool; and every employee, vehicle and delivery leaves an auditable trail that feeds billing, payroll and accountability without extra paperwork.

WHO IS IN THE SYSTEM

Six portals, two worlds

The platform is split into **Jadvix's world** (we sell & bill) and the **customer's world** (they operate). Inside a customer, there is a **hub-authority side** and an **employee side**.

Jadvix's world

JADVIX INTERNAL

Master Portal

Our commercial cockpit. Lists every client company, its hubs and employees; shows what each owes; generates monthly invoices; and issues each company its Super Admin credentials (company name + password).

CLIENT – OWNER

Super Admin Portal

The company's headquarters view. Runs every operating module across all hubs, adds/edits hubs, sets a **default hub** for the whole dashboard, issues credentials for each hub's authorities and drivers, and **decides which modules each role can access**.

The customer's world — hub-authority side

HUB AUTHORITY

Hub Manager Portal

The senior role in a hub — runs it end-to-end: products, employees, shifts, bays, locations, vehicles, leave and communication, scoped by what Super Admin grants.

HUB AUTHORITY

Hub Team Leader Portal

Frontline supervision — shift and bay execution, leave approvals and driver queries for their team.

HUB AUTHORITY

Hub HR & Finance Portal

The money desk of a hub: salary & invoices, billing & penalties, and stats — usually restricted to just those.

The customer’s world — employee side

EMPLOYEE

Driver Portal

The road-facing app: daily vehicle check-in with four-side photos, assigned deliveries, leave requests, payslips, penalties, and a query channel to hub authorities. Sees a focused subset — never the management modules.

Not every hub has every role

Super Admin composes each hub from the roles it actually needs. Hub 1 might be just **Manager + HR&Finance**; Hub 2 might be **Manager + Team Leader**. Credentials and module access are created per hub.

HOW IT FITS TOGETHER

The hierarchy, as a tree

Authority flows top-down; each level creates and scopes the level below it.

Master → Company (Super Admin) → Hubs → Hub authorities → Drivers.

END-TO-END WORKFLOW

From signup to invoice, one loop

The whole business runs as a repeating monthly loop: onboard, configure, operate, settle, bill.

1

Onboard — Jadvix

Master Portal registers the client company and generates its Super Admin credentials (company name + password), handed over securely.

2

Configure — Super Admin

Creates each hub (name, location, images, address), issues hub code + email credentials for each hub authority and driver, ticks the modules each role may access, and picks a **default hub** for the dashboard.

3

Operate — Hub authorities & drivers

Drivers check in with four-side vehicle photos before a shift; authorities plan shifts and bays; deliveries run; leave, queries and messages flow through their permitted channels — everything logged.

4

Settle — HR & Finance

The hub's finance desk calculates salaries and raises payslips and invoices to drivers/staff, weekly or monthly, applying any penalties.

5

Bill — Master

Jadvix meters hubs and employees created that month, applies the setup fee and any leaver proration, and issues the company its invoice.

HOW JADVIX EARNS

Usage-based revenue, metered automatically

Two money flows live in the system, and they never mix: **Jadvix** → **charges the company** (the Master Portal), and inside the company, **hub finance** → **pays the drivers** (Salary & Invoice).

What the company pays Jadvix

CHARGE	BASIS	WHEN
Setup fee	Flat platform / onboarding fee	Recurring monthly
Per hub	Each hub created in the company	Monthly
Per employee	Each employee created	Monthly, with proration ↓

Employee proration — the leaver rule

A company is charged per employee even for short tenures, so churn still carries cost. The rule as proposed:

EMPLOYEE TENURE BEFORE LEAVING	COMPANY PAYS JADVIX
Worked 0–14 days, then resigned	50% (half)
Worked 14–28 days	100% (full)
Merely created & deleted (no real work)	50% (half)

The 14-day boundary and the 28-day threshold need a precise definition (inclusive/exclusive, and what happens past 28 days) — flagged under Open decisions.

MODULES & ACCESS CONTROL

Fifteen modules, granted role by role

Every portal is assembled from the same catalogue of modules. Super Admin decides, per role and per hub, which are visible — starting from sensible defaults that can be tightened or opened at any time.

MODULE	SUPER ADMIN	MANAGER	TEAM LEAD	HR&FINANCE	DRIVER
Dashboard	●	●	●	●	●
Stats	●	●	●	○	—
Product Management	●	●	●	○	—
Employee Management	●	●	●	○	—
Shift Management	●	●	●	○	—
Bay Management	●	●	●	○	—
Location Management	●	●	●	○	—
Hub Management	●	—	—	—	—
Leave Requests	●	●	●	●	●
Communication	●	●	●	●	●
Vehicle Management	●	●	●	●	●
Salary & Invoice	●	●	●	●	●
Billing & Penalties	●	●	●	●	●
Queries	●	●	●	●	●
Reminders	●	●	●	●	●
Settings	●	●	●	●	●

● On by default ○ Off by default — Super Admin can grant — Not applicable to this role

Everything is overridable. Defaults are just the starting point — Super Admin can restrict a granted module or open a hidden one for any role, per hub. HR & Finance is the classic case: born with only its money modules and Stats, and widened only if the company wants.

Settings is per-portal. The Settings module exists everywhere, but each portal sees different settings — a driver’s Settings is not a Super Admin’s.

SIGNATURE FEATURES

The details that make it real

These behaviours are what turn a set of screens into an operations system people trust.

Hub Management & default hub

Full CRUD for hubs — location, images, address. Pick one as the **default hub** and the entire dashboard and every module shows that hub’s data. Switch the hub to see how any other is performing, from the same seat.

Role-based module access

Super Admin builds each portal by ticking modules. A credential is **hub code + email**. Sensible defaults are pre-selected; tighten or widen per role and per hub.

Bay Management — freeze & reuse

A **Complete** button locks today's bay plan as **immutable** and files it as a past day. A **calendar view** browses yesterday, last week, any date — and **duplicates a past day onto today** in one click.

Snapshot & import/export

A Settings **Snapshot** saves today's bays, employees and vehicles as a downloadable **PNG**. Bays also **import/export** via Excel, CSV, PDF and Word.

Vehicle check-in = attendance + safety

Before a shift, the driver submits **four-side vehicle photos**. That single act proves the driver is present *and* the vehicle is roadworthy. **No check-in for 2 days** → an automatic alert to authorities in Reminders.

Leave that ripples through

Employees raise leave; Super Admin decides **who receives** the request (manager / team lead / HR). Once on leave, the person's name is **greyed/blurred and un-assignable** in Bay and Employee Management for that day.

Communication with guardrails

When creating an employee, Super Admin sets **who that person may message**. Drivers can't freely message managers or team leaders — only the recipients they're granted.

Queries & blameless error counts

A channel for the serious stuff — accidents, salary mismatches, delivery errors, suspected fraud. The **delivery-error count is visible to everyone**, but the **offender's name is shown only to that employee and authorised authorities**.

Reminders as the alert hub

Leave requests, missed check-ins, and important notices land here for the authorities set to receive them — so nothing critical gets lost in chat.

Shifts start-only

A shift has a **start time only** — no end time — matching how dispatch waves actually run.

Bay day lifecycle

WHY IT MAKES LIFE EASIER

What each seat actually gains

JADVIX

Predictable, automatic revenue

Every hub and employee a customer creates is metered and invoiced without manual counting. Growth in their business is growth in ours.

COMPANY OWNER

One glass, every hub

Switch the default hub and see the whole operation — staff, bays, deliveries, money — without calling anyone. Control access centrally.

HUB AUTHORITIES

Plan once, reuse forever

Freeze and duplicate bay plans, approve leave in one place, and act on real alerts instead of scrolling group chats.

HR & FINANCE

Payroll & penalties without spreadsheets

Salary, invoices and penalties computed from the same operational data — weekly or monthly — with a clean paper trail.

DRIVERS

A simple, fair daily tool

Check in with a few photos, see the day's work, raise a genuine issue, and view payslips — errors are counted fairly, names kept private.

THE BUSINESS

Accountability by design

Attendance, vehicle condition, delivery errors and disputes are all logged as they happen — fewer arguments, faster resolutions, less leakage.

OPEN DECISIONS

Things to lock before build

Captured now so the boss meeting can settle them — none block the concept, all shape the build.

Product name

"Jadvix HubOS" is a placeholder. Pick the real name and we brand the portals around it.

Login model

Master issues Super Admin as **company name + password**; Super Admin issues hubs as **hub code + email**. Confirm whether hub/driver logins use a password at all, or hub code + email only.

Proration boundaries

Define the 14-day and 28-day thresholds precisely (inclusive vs exclusive) and the charge for tenure beyond 28 days.

Pricing numbers

The *model* is set (setup + per hub + per employee); the actual amounts and currency/tax handling still need to be filled in.

Query visibility rules

Exactly which authority roles may see an offender's identity, and how "authorised to see" is granted.

Roles & terms at a glance

TERM	MEANING
Master Portal	Jadvix’s internal portal — sells the software, meters usage, bills companies.
Super Admin	A client company’s owner account — runs all hubs, issues credentials, controls module access.
Hub	A physical delivery centre with its own staff, vehicles, bays and deliveries.
Hub authority	Manager, Team Leader, or HR & Finance — the three management roles inside a hub.
Default hub	The hub whose data the dashboard and modules show until you switch.
Bay	A numbered loading slot pairing a driver + vehicle with products and a delivery location for a shift.
Check-in	A driver’s four-side vehicle photo submission — doubles as attendance and safety proof.
Snapshot	A downloadable PNG of the day’s bays, employees and vehicles.
Query	A logged report of a serious event — accident, salary mismatch, delivery error, fraud.
